### DESCRIPTION:

Thanks to their composition based on natural active ingredients, PARASITAL® Pipettes for Small Dogs and Cats are effective against external parasites. Ticks, fleas, flies and even the mosquito that transmits leishmaniosis, will no longer be a problem, providing well-being and peace of mind to pets and owners alike.

### INDICATIONS:

The products that are part of the PARASITAL® range are suitable for eliminating the discomfort caused by insects and mites, a common problem in the daily life of our pets. With high repellent power and endurance, the PARASITAL® range will look after your pets in a natural fashion. Independent approved laboratories guarantee the extraordinary effectiveness and endurance of the active ingredients.

Experimental studies have also demonstrated their repellent effectiveness against Phlebotomus mosquitoes, which transmit Leishmaniosis. PARASITAL® provides the necessary degree of comfort and well-being, making the day-to-day life of the animal and its owner much easier.

PARASITAL® Pipette for Small Dogs and Cats can be used to fend off attacks against our pets by fleas, ticks, flies and mosquitoes.

### MODE OF USE:

Use on non-infested animals, by applying the content of the necessary number of pipettes to the area joining the neck and the back, and the base of the tail, lifting up the animal's hair so that the liquid enters into contact with the skin.

Apply once per month for continuous protection or more frequently if necessary. In areas where insects are a seasonal problem, it is advisable to apply PARASITAL® Pipettes for Small Dogs and Cats 3 or 4 weeks before the onset of insect activity.

• Water resistance: the repellent antiparasitic pipettes continue to protect the animal if it comes into contact with water, but if dry shampoo has been applied or the animal has been bathed, the product should be re-applied once the animal is clean and dry.

• At home: the repellent pipettes for small dogs and cats will protect your animal from new fleas, ticks or mosquitoes, but they will not eliminate an existing infestation. If your animal has fleas or ticks, or if they are present in your home, an appropriate treatment must be applied before using the pipettes.
